J. Biol. Chem. 273:9234-9242(1999).

-!- FUNCTION: Immunoglobulin-like cell surface receptor for CD47. Acts as docking protein and induces translocation of PTPN6, as docking protein and induces translocation of PTPN6.

PTPN11 and other binding partners from the cytosol to the plasma membrane. Supports adhesion of cerebellar neurons, neurite outgrowth and glial cell attachment. May play a key role in intracellular signaling during synaptogenesis and in synaptic function. Involved in the negative regulation of receptor tyrosine kinase-coupled cellular responses induced by cell adhesion, growth factors or insulin. Mediates negative regulation of phagocytosis, mast cell activation and dendritic cell activation. CD47 binding prevents maturation of immature dendritic cells and inhibits cytokine production by mature dendritic cells. May play a role in the release of intric oxide by macrophages (By similarity).

-!- SUBUNIT: Binds JAK2 irrespective of its phosphorylated, except in macrophages, where it primarily binds PTPN6. Binds GRB2 in vitro. Binds FGR. Binds JAK2 irrespective of its phosphorylation status and forms a stable complex. Binds SCAP1 and/or SCAP2. The resulting complex recruits FYB. Binds FTK2B (By similarity).

TISSUE SPECIFICITY: Primarily expressed in brain.
SIMILARITY: Contains 10 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 6 fibronectin type III domains.

In adult, highly expressed brain with very low levels found in testis, heart and thymus. Isoform C is expressed only in the embryo.

DEVELOPMENTAL STAGE: Low levels in early gestation. Highest lexpressed during mid gestation. Levels decrease in late gesta and remain at this level in the adult.

SIMILARITY: Belongs to the immunoglobulin superfamily. DCC fa SIMILARITY: Contains 4 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                     European Bioinformatics Institute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Supports adhesion of cerebellar neurons, neurite outgrowth and glial cell attachment. May play a key role in intracellular signaling during synaptogenesis and in synaptic function (By similarity). Involved in the negative regulation of receptor tyrosine kinase-coupled cellular responses induced by cell adhesion, growth factors or insulin. Mediates negative regulation of phagocytosis, mast cell activation and dendritic cell activation. CD47 binding prevents maturation of immature dendritic cells and inhibits cytokine production by mature dendritic cells.

-ISUBUNIT: Binds PTPN11 when tyrosine-phosphorylated, except in macrophages, where it primarily binds PTPN6. Binds GRB2 in vitro. Binds FGR (By similarity). Binds JAK2 irrespective of its phosphorylation status and forms a stable complex. Binds SCAP1 and/or SCAP2. The resulting complex recruits FYB. Binds PTK2B.
-I- SUBCELLULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This

XI' The complete sequences of 100 new cDNA clones from brain which code TISSUE-Brain Nakajima D., Okazaki N., Yamakawa H., MEDLINE=22158633; PubMed=12168954; MEDLINE=99246063; PubMed=10231032; SEQUENCE SUBDRIT: Interacts with F-actin via its N-terminal domain. SUBCELLULAR LOCATION: Type IV membrane protein (Potential). The largest part of the protein is cytoplasmic, while its C-terminal part is associated with the nuclear envelope, most probably the outer nuclear membrane. Remains associated with the nuclear envelope during its breakdown in mitotic cells. ALTERNATIVE PRODUCTS: Event-Alternative splicing; Named isoforms=9; FUNCTION: Involved in the maintenance of nuclear organization structural integrity. Probable anchoring protein which theter nucleus to the cytoskeleton. Connects nuclei to the cytoskele by interacting with the nuclear envelope and with F-actin in large proteins in vitro."; Res. 6:63-70(1999). cytoplasm. ime=4; Synonyms=Beta; IsoId=Q8WXH0-4; Sequence=VSP_007156. SIMILARITY: Belongs to the nesprin family.
SIMILARITY: Contains 1 actin-binding domain.
SIMILARITY: Contains 2 calponin-homology (CH) domair.
SIMILARITY: Contains 1 Klarsicht domain.
SIMILARITY: Contains 13 leucine-rich (LRR) repeats.
SIMILARITY: Contains 9 spectrin repeats.

INVOLVED IN NEURITE EXTENSION E NEURONS VIA HETEROPHILIC AND HOMOPHILIC INTERACTIONS.
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: PRESENT ON ALL RETINAL GANGLION CELLS (RGCS)
AND THEIR AXONS (IN EMBRYO). ABSENT FROM MATURE AXONS ALONG MOST OF THEIR LENGTH, BUT IS PRESENT ON NEW AND GROWING AXONS DERIVED FROM THE RGCS AT THE RETINAL MARGIN. REMAINS ON ADULT RGCS ONLY A CELL-CELL CONTACT SITES AND IS CONTINUOUSLY FOUND IN THE RETINAL AXON TERMINAL ARBOR LAYERS OF THE ADULT TECTUM.

SIMILARITY: Belongs to the immunoglobulin superfamily.
Ll/neurofascin/NgCAM family.
SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 5 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to axonin on neurons.

 Score
 peq
pee
 protein search, using sw model
 length: 0
length: 2000000000
 is the number of results predicted by chance to have a ater than or equal to the score of the result being printed, rived by analysis of the total score distribution.

DR N
 The fusion protein genes of the invention pref. comprise cDNA sequences which encode CD4 or a fragment which binds gp120 ligated to an expression plasmid which encodes an antibody in which the variable region of the gene has been deleted (see WO87-02671). The CD4 portion of the fusion

 protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The Igheavy chain is pref. from IgM, IgG1 or IgG3. The following are specifically claimed: fusion proteins CD4H-gamma-1,CD4Mmu,CD4Pmu,CD4E-gamma1, and CD4Mmu (No.67608), pCD4P-gamma (No.67609) and pCD4E-gamma-1 (No.67601). The plasmid containing (pCD4E-gamma-1) has been deposited in E. coli (MC1651/P3) at the ATCC under accession number 67610. (Updated or 25-MAR-2003 to correct PA field.)

 The present sequence is that of fusion protein CD4Egammal comprising the extracellular portion of CD4, which binds to HIV gpl20, linked at its C-terminus to the human IgG1 heavy chain. To obtain the fusion protein, DNA encoding CD4 was linked to IgG1 DNA at the Esp site upstream of the hinge region (see AAA50661). Fusion protein CD4Egammal and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgG1 fusion proteins such as CD4Egammal provide both complement-mediated and cell-mediated immunity

This invention describes a novel nucleic acid (I) encoding a fusion protein comprising a DNA sequence encoding amino acids 1-173 of CD4 (II) and a DNA sequence encoding a human immunoglobulin (Ig) heavy or light chain (III). The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gpl20. The fusion protein is useful for treating human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). This sequence represents the fusion protein CD48gammal which is constructed from CD4 linked to human IgG1 upstream of the hinge region

ä

The invention provides a fusion gene encoding a fusion protein that comprises an extracellular CD4 DNA sequence or its fragment which binds to HIV gp120 when fused to an immunoglobulin (1g) chain and the DNA sequence of an Ig heavy or light chain, where the DNA sequence which encodes the variable region has been replaced with the DNA sequence which encodes extracellular CD4 or its gp120 binding fragment. The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections. The present sequence represents the fusion protein in in humans. The present sequence represents the fusion protein CD4Egammal where the CD4 is linked to human IgG1 at the Esp site upstream hinge region

 The fusion protein genes of the invention pref. comprise cDNA sequences which encode CD4 or a fragment which binds gpl20 ligated to an expression plasmid which encodes an antibody in which the variable region of the gene has been deleted (see WOS7-02671). The CD4 portion of the fusion protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The Ig heavy chain is pref. from IgM, IgG1 or IgG3. The following are specifically claimed: fusion proteins CD4H-gamma-1, CD4Mmu, CD4P-gamma1, and CD4Mmu (NO.67608), pCD4P-gamma (NO.67609) and pCD4E-gamma1.

(NO.67610). The plasmid containing (pCD4H-gamma-1) has been deposited in E. coli (MC1061/P3) at the ATCC under accession number 67611. (Updated on 25-MAR-2003 to correct PA field.)
 Sequence 729 AA;
 Immunoglobulin-CD4 fusion proteins - used for treating HIV infections or detecting HIV or SIV in sample.
 Fusion protein; immunoglobulin-like molecule; HIV; SIV; therapy; diagnosis; CD4; gp120; binding fragment; glycoprotein; variable region.
 Genetic construct which encodes site upstream of the CH1 region

 The present sequence is that of fusion protein CD4Hgammal comprising the extracellular portion of CD4, which binds to HIV gp120, linked at its C-terminus to the human IgG1 heavy chain. To obtain the fusion protein, DNA encoding CD4 was linked to IgG1 DNA at the Hind3 site upstream of the CH1 region (see AAA50660). Fusion protein CD4Hgammal and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgG1 fusion proteins such as CD4Hgammal provide both complement-mediated and cell-mediated immunity

 The invention provides a fusion gene encoding a fusion protein that comprises an extracellular CD4 DNA sequence or its fragment which binds to HIV gp120 when fused to an immunoglobulin (Ig) chain and the DNA sequence of an Ig heavy or light chain, where the DNA sequence encoding the variable region has been replaced with the DNA sequence which encodes extracellular CD4 or its gp120 binding fragment. The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful infections in humans. The present sequence represents the fusion protein CD4Hgamma1 where the CD4 is linked to human IgG1 at the Hind3 site
 Sequence 729 AA;
 New fusion gene encoding immunoglobulin-CD4 fusion proteins, useful the treatment of HIV or simian immunodeficiency virus infections.
